## Student Exploration: Equilibrium and Concentration

**Vocabulary:** chemical equilibrium, concentration, equilibrium, equilibrium constant, reaction quotient, reversible reaction

**Prior Knowledge Questions** (Do these BEFORE using the Gizmo.)

Gary has \$5,000 in his bank account and earns a modest salary. Every month he pays for rent, food, utilities, and entertainment.

- How will Gary's account change if he saves more than he spends? \_\_\_\_\_
- How will Gary's account change if he spends more than he saves? \_\_\_\_\_
- What happens if Gary spends exactly as much as he saves? \_\_\_\_\_

### Gizmo Warm-up

If Gary spends exactly as much as he earns, his savings will be in **equilibrium**. Equilibrium occurs when two opposing processes occur at the same rate, leading to no net change. In the *Equilibrium and Concentration* Gizmo™, you will investigate how equilibrium can occur in chemical reactions.

To begin, check that **Reaction 1** is selected. Set **Moles NO<sub>2</sub>** to 8 and **Moles N<sub>2</sub>O<sub>4</sub>** to 0.

- Click **Play** (▶) and observe the colliding molecules. What do you notice? \_\_\_\_\_

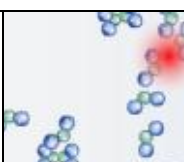

In the Gizmo, a blue flash appears every time two reactants combine to form a product. A red flash appears every time a product dissociates into reactants.

- Click **Reset** (↺), and set **Moles NO<sub>2</sub>** to 0 and **Moles N<sub>2</sub>O<sub>4</sub>** to 8. Click **Play**.

What do you notice now? \_\_\_\_\_

- When a reaction can proceed in either direction, it is a **reversible reaction**. Based on what you have observed, is the synthesis of NO<sub>2</sub> into N<sub>2</sub>O<sub>4</sub> a reversible reaction? Explain.

\_\_\_\_\_  
\_\_\_\_\_

<b>Activity A:</b>  <b>Reversible reactions</b>	<u>Get the Gizmo ready:</u> <ul style="list-style-type: none"> <li>Click <b>Reset</b>. <b>Reaction 1</b> should be selected.</li> <li>Set <b>Moles NO<sub>2</sub></b> to 8 and <b>Moles N<sub>2</sub>O<sub>4</sub></b> to 0.</li> <li>Move the <b>Sim. speed</b> slider all the way to the right.</li> </ul>	
---	--	---

**Question: What are the characteristics of reversible reactions?**

1. Predict: Suppose you began with 8 moles of NO<sub>2</sub> in the chamber. What do you think will happen if you let the reaction go for a long time? \_\_\_\_\_

2. Test: Click **Play**. Select the **Bar Chart** tab and check that **Moles** is selected. Observe the bar chart for about 30 seconds. As time goes by, what do you notice about the bars representing moles NO<sub>2</sub> and moles N<sub>2</sub>O<sub>4</sub>? \_\_\_\_\_

3. Observe: Click **Pause** (⏸). Select the **Graph** tab. Click the (–) zoom control on the horizontal axis until you can see the whole graph. What do you notice? \_\_\_\_\_

This situation, in which the overall amounts of reactants and products does not change significantly over time, is called a **chemical equilibrium**.

4. Record: On the **Bar Chart** tab, turn on **Show data values**. How many moles of NO<sub>2</sub> and N<sub>2</sub>O<sub>4</sub> are there right now?      Moles NO<sub>2</sub> \_\_\_\_\_      Moles N<sub>2</sub>O<sub>4</sub> \_\_\_\_\_

5. Calculate: Suppose all the NO<sub>2</sub> molecules were synthesized into N<sub>2</sub>O<sub>4</sub>. Given the equation  $2\text{NO}_2 \leftrightarrow \text{N}_2\text{O}_4$ , how many moles of N<sub>2</sub>O<sub>4</sub> would be produced? \_\_\_\_\_

6. Experiment: Click **Reset**. On the **Initial Settings** tab, set **Moles NO<sub>2</sub>** to 0 and **Moles N<sub>2</sub>O<sub>4</sub>** to 4. Click **Play**. Click **Pause** when the bars of the **Bar Chart** stop moving very much.

A. List the current amounts of each substance: Moles NO<sub>2</sub> \_\_\_\_\_ Moles N<sub>2</sub>O<sub>4</sub> \_\_\_\_\_

B. How do these results compare to starting with 8 moles of NO<sub>2</sub>? \_\_\_\_\_

**(Activity A continued on next page)**

### Activity A (continued from previous page)

7. Summarize: How do the initial settings affect the equilibrium amounts of each substance?

---

---

8. Set up the Gizmo: Click **Reset** and select the **Experiment** tab on the left. On the **Initial Settings** tab on the right, select **Reaction 2**. Set **Moles NO** to 5, **Moles NO<sub>2</sub>** to 5, and **Moles N<sub>2</sub>O<sub>3</sub>** to 0. What are the reactants and product of this reaction?

Reactants: \_\_\_\_\_ Product: \_\_\_\_\_

9. Observe: Recall that a blue flash appears every time two reactants combine to form a product. A red flash appears every time a product dissociates into reactants. Click **Play**.

A. At first, do you notice more blue flashes or red flashes? \_\_\_\_\_

B. What do you notice about the frequency of blue and red flashes as time goes by?

---

C. Click **Reset**. This time, start the experiment with 0 moles of NO and NO<sub>2</sub>, and 5 moles of N<sub>2</sub>O<sub>3</sub>. Click **Play**. What do you notice about the red and blue flashes now?

---

---

10. Explain: Think about how the numbers of blue and red flashes reflect the rates of the forward (reactants → products) and reverse (products → reactants) reactions.

A. What happens to the rate of the forward reaction as the reactants are consumed?

---

B. What happens to the rate of the reverse reaction as the products are produced?

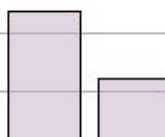

---

C. Why do reversible reactions *a/ways* result in chemical equilibria? \_\_\_\_\_

---

---

---

<b>Activity B:</b>  <b>The equilibrium constant</b>	<u>Get the Gizmo ready:</u> <ul style="list-style-type: none"> <li>Click <b>Reset</b>. Select <b>Reaction 1</b>.</li> <li>Set <b>Moles NO<sub>2</sub></b> to 2 and <b>Moles N<sub>2</sub>O<sub>4</sub></b> to 7.</li> </ul>	
---	---	---

**Introduction:** When investigating the rates of reactions, it often is useful to consider the **concentrations** of reactants rather than the total number of moles. Concentrations are often expressed in moles per liter, or mol/L. Brackets are used to signify concentration. For example, “[H<sub>2</sub>] = 5.0 M” means the concentration of hydrogen gas in a chamber is 5.0 moles per liter.

**Question: What are the characteristics of reactions in equilibrium?**

1. Record: On the **Bar Chart** tab, select **Concentration**. Check that **Show data values** is on. If necessary, use the arrows to adjust the scale of the chart.

A. What are the current concentrations of each compound?

[NO<sub>2</sub>] \_\_\_\_\_

[N<sub>2</sub>O<sub>4</sub>] \_\_\_\_\_

B. Click **Play** and wait for equilibrium to become established. Click **Pause**. What are the approximate equilibrium concentrations?

[NO<sub>2</sub>] \_\_\_\_\_

[N<sub>2</sub>O<sub>4</sub>] \_\_\_\_\_

2. Calculate: The value  $K_c$  represents the ratio of products to reactants in a reaction at equilibrium. The greater the amount of products relative to reactants, the higher the resulting value of  $K_c$ . For a general reaction between gases:  $aA(g) + bB(g) \leftrightarrow cC(g) + dD(g)$ ,  $K_c$  is calculated as follows:

$$K_c = \frac{[C]^c [D]^d}{[A]^a [B]^b}$$

For the current reaction,  $2\text{NO}_2 \leftrightarrow \text{N}_2\text{O}_4$ , we have:

$$K_c = \frac{[\text{N}_2\text{O}_4]}{[\text{NO}_2]^2}$$

Based on the current concentrations of NO<sub>2</sub> and N<sub>2</sub>O<sub>4</sub>, what is  $K_c$ ? \_\_\_\_\_

Show your work here:

(Activity B continued on next page)

### Activity B (continued from previous page)

3. Gather data: Experiment with a variety of initial concentrations of  $\text{NO}_2$  and  $\text{N}_2\text{O}_4$ . For each set of initial concentrations, use the Gizmo to determine the equilibrium concentrations of each substance. In the last column, find  $K_c$  for that trial. Run three trials for each set of initial conditions.

Initial [ $\text{NO}_2$ ]	Initial [ $\text{N}_2\text{O}_4$ ]	Equilibrium [ $\text{NO}_2$ ]	Equilibrium [ $\text{N}_2\text{O}_4$ ]	$K_c$

4. Calculate: Find the average value of  $K_c$  for each set of three trials.

Trials 1-3: \_\_\_\_\_

Trials 4-6: \_\_\_\_\_

Trials 7-9: \_\_\_\_\_

5. Analyze: What do you notice about the values of  $K_c$ ? \_\_\_\_\_

\_\_\_\_\_

In general, the value of  $K_c$  will be constant for a given reaction at a constant temperature, no matter the starting concentrations. That is why  $K_c$  is known as the **equilibrium constant**. In this Gizmo, the values of  $K_c$  will vary somewhat because there is a very limited number of molecules in the chamber.

6. On your own: Use the Gizmo to find  $K_c$  for **Reaction 4**:  $\text{H}_2 + \text{I}_2 \leftrightarrow 2\text{HI}$ . Collect data at least 10 times and average your results to get the best approximation of  $K_c$ . Show your data and work on a separate sheet of paper.

(Hint: Because of the coefficient “2” in front of HI, you will have to square the concentration of HI to find  $K_c$ .)

$K_c$  = \_\_\_\_\_

<b>Activity C:</b>  <b>Reaction direction</b>	<u>Get the Gizmo ready:</u> <ul style="list-style-type: none"> <li>Click <b>Reset</b>. Check that <b>Reaction 4</b> is selected.</li> <li>Set <b>Moles H<sub>2</sub></b> to 5, <b>Moles I<sub>2</sub></b> to 5, and <b>Moles HI</b> to 3.</li> </ul>	
---	--	---

**Introduction:** For a reversible reaction with equilibrium constant  $K_c$ , it often is useful to know in which direction the reaction will proceed given the starting amounts of reactants A and B and products C and D. This is done by calculating the **reaction quotient**,  $Q_c$ :

$$Q_c = \frac{[C]^c [D]^d}{[A]^a [B]^b}$$

**Question: How can you predict the direction of a reversible reaction?**

1. List: Select the **Bar Chart** tab. What are the initial concentrations of each substance?

[H<sub>2</sub>] \_\_\_\_\_ [I<sub>2</sub>] \_\_\_\_\_ [HI] \_\_\_\_\_

2. Calculate: Use the equation above to find  $Q_c$  for the current reaction.

- A. What is the current value of  $Q_c$ ? \_\_\_\_\_
- B. In activity B, what value of  $K_c$  did you arrive at for this reaction? \_\_\_\_\_
- C. How does  $Q_c$  compare to  $K_c$ ? \_\_\_\_\_

3. Analyze: Recall that  $Q_c$  is equal to the ratio of product concentrations to reactant concentrations.

- A. If there is an excess of products, will  $Q_c$  be greater than or less than  $K_c$ ? \_\_\_\_\_
- B. If there is an excess of reactants, will  $Q_c$  be greater than or less than  $K_c$ ? \_\_\_\_\_
- C. In the current situation, is there an excess of products or reactants? \_\_\_\_\_

Explain: \_\_\_\_\_

- D. When the reaction begins, do you expect [HI] to increase or decrease? \_\_\_\_\_

Explain: \_\_\_\_\_

4. Test: Click **Play**. What happens to [HI]? \_\_\_\_\_

\_\_\_\_\_

<b>Extension:</b>  <b>Equilibrium calculations</b>	<u>Get the Gizmo ready:</u> <ul style="list-style-type: none"> <li>Click <b>Reset</b>. Select <b>Reaction 1</b>.</li> <li>Set <b>Moles NO<sub>2</sub></b> to 0 and <b>Moles N<sub>2</sub>O<sub>4</sub></b> to 6.</li> </ul>	
--	---	---

**Goal: Given  $K_c$  and initial concentrations, calculate equilibrium concentrations.**

1. List: Select the **Bar Chart**. What is the initial concentration N<sub>2</sub>O<sub>4</sub>?  $[N_2O_4]_{initial} = \underline{\hspace{2cm}}$

2. Experiment: Click **Play** and wait for a few seconds. Click **Pause** before equilibrium is reached.

A. What is the current concentration of N<sub>2</sub>O<sub>4</sub>?  $[N_2O_4] = \underline{\hspace{2cm}}$

B. How much has the concentration of N<sub>2</sub>O<sub>4</sub> gone down?  $\underline{\hspace{2cm}}$

C. What is the current concentration of NO<sub>2</sub>?  $[NO_2] = \underline{\hspace{2cm}}$

D. In general, if [N<sub>2</sub>O<sub>4</sub>] is reduced by x, how much does [NO<sub>2</sub>] increase?  $\underline{\hspace{2cm}}$

3. Manipulate: Begin with the general equation for  $K_c$ :  $K_c = \frac{[C]^c [D]^d}{[A]^a [B]^b}$ .

A. What is the equation for  $K_c$  for the reaction  $2NO_2 \leftrightarrow N_2O_4$ ?  $K_c = \underline{\hspace{2cm}}$

B. In this experiment, the initial concentration of NO<sub>2</sub> is zero. If the concentration of N<sub>2</sub>O<sub>4</sub> is reduced by x at equilibrium, the equilibrium concentration of NO<sub>2</sub> is equal to x. Substitute the following values into the equation you wrote in step A:

$$[N_2O_4] = ([N_2O_4]_{initial} - x) \qquad [NO_2] = x$$

$$K_c = \underline{\hspace{2cm}}$$

C. In activity A, you discovered that  $K_c$  for this reaction was close to 0.042. Substitute this value and the initial concentration of N<sub>2</sub>O<sub>4</sub> into your equation.

$$= \underline{\hspace{2cm}}$$

D. Rearrange the terms of your equation to form a quadratic equation in the form  $ax^2 + bx + c = 0$ .

$$= 0$$

**(Extension continued on next page)**

### Extension (continued from previous page)

4. Solve: Because the equation is in the form  $ax^2 + bx + c = 0$ , you can use the quadratic formula (shown below) to solve for  $x$ . Ignore negative solutions because the concentrations cannot be negative. Show your work.

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

5. Predict: Based on the value for  $x$ , what do you expect the equilibrium concentrations of  $\text{NO}_2$  and  $\text{N}_2\text{O}_4$  to be?

$[\text{NO}_2]$  \_\_\_\_\_  $[\text{N}_2\text{O}_4]$  \_\_\_\_\_

Check your work by solving for  $K_c$  using  $K_c = \frac{[\text{N}_2\text{O}_4]}{[\text{NO}_2]^2}$   $K_c =$  \_\_\_\_\_

If you don't get the correct value of  $K_c$ , recheck your work.

6. Test: Click **Play** and wait for equilibrium to be established. What are the actual equilibrium values of each substance?

$[\text{NO}_2]$  \_\_\_\_\_  $[\text{N}_2\text{O}_4]$  \_\_\_\_\_

How close were these results to your predicted results? \_\_\_\_\_

---

7. Challenge: Suppose you begin with 6 moles of  $\text{NO}_2$  and 5 moles of  $\text{N}_2\text{O}_4$ . Assuming a value for  $K_c$  of 0.042, predict the equilibrium concentrations of  $\text{NO}_2$  and  $\text{N}_2\text{O}_4$ . (Use the Gizmo to determine the initial concentrations.) Show your work on a separate sheet of paper. After you have made your predictions, click **Play** and record the experimental results.

Predicted:  $[\text{NO}_2]$  \_\_\_\_\_  $[\text{N}_2\text{O}_4]$  \_\_\_\_\_

Experimental:  $[\text{NO}_2]$  \_\_\_\_\_  $[\text{N}_2\text{O}_4]$  \_\_\_\_\_
